Recoding Variable Values

David Gerard

2020-10-07

Learning Objectives

- Changing the values of a variable based on its current value with recode().
- Changing the values of a variable based on logical statements with if_else().
- Replacing NA's with replace_na().

Change variable values with recode()

- Variable values are sometimes uninformative. You might want to change these values before plotting
 or calculating summary statistics.
- E.g. the estate data in "estate.csv" at https://dcgerard.github.io/stat 412 612/data/estate.csv:

```
library(tidyverse)
estate <- read_csv(file = "https://dcgerard.github.io/stat_412_612/data/estate.csv")</pre>
```

- estate contains the following variables:
 - Price: Sales price of residence (in dollars)
 - Area: Finished area of residence (in square feet)
 - Bed: Total number of bedrooms in residence
 - Bath: Total number of bathrooms in residence
 - AC: 1 = presence of air conditioning, 0 = absence of air conditioning
 - Garage: Number of cars that a garage will hold
 - Pool: 1 = presence of a pool, 0 = absence of a pool
 - Year: Year property was originally constructed
 - Quality: Index for quality of construction. High, Medium, or Low.
 - Style: Categorical variable indicating architectural style
 - Lot: Lot size (in square feet)
 - Highway: 1 = highway adjacent, 0 = highway not adjacent.
- It would be better if we could change the 0/1 coding for AC, Pool, and Highway to something more informative. That way we won't have to always look up the coding during our analysis.
- recode():
 - Takes a vector as its first argument.
 - Each subsequent argument contains two values separated by an equals sign.
 - The value on the left of the equals sign is the current value inside the vector.
 - The value on the right of the equals sign is the new value for the vector.

- If the current current value inside the vector is a numeric, then you need to surround its value by backticks "`.".
- It returns a vector with replaced values.
- Toy example:

```
char_vec <- c("a", "a", "b", "c", "c", "a", "b", "b", "c")
recode(char_vec,
       a = "Apple")
## [1] "Apple" "Apple" "b"
                                                "Apple" "b"
                                "c"
                                        "c"
                                                                 "b"
                                                                         "c"
recode(char_vec,
       b = "Banana")
                "a"
## [1] "a"
                         "Banana" "c"
                                            "c"
                                                     "a"
                                                               "Banana" "Banana"
## [9] "c"
recode(char_vec,
       a = "Apple",
       b = "Banana",
       c = "Carrot")
## [1] "Apple" "Apple" "Banana" "Carrot" "Carrot" "Apple" "Banana" "Banana"
## [9] "Carrot"
```

• Exercise: In the below vector, recode "Bob" to be "Robert", "John" to be "Jonathan", and "Dave" to be "David".

```
namevec <- c("Bob", "John", "John", "Dave", "Bob", "Bob", "Dave", "John")</pre>
```

• Let's use recode() in to change the Quality values in the estate data frame. Recall: we need to use mutate() to modify a variable in a data frame.

```
## Rows: 522
## Columns: 12
## $ Price
             <dbl> 360000, 340000, 250000, 205500, 275500, 248000, 229900, 150...
## $ Area
             <dbl> 3032, 2058, 1780, 1638, 2196, 1966, 2216, 1597, 1622, 1976,...
## $ Bed
             <dbl> 4, 4, 4, 4, 4, 4, 3, 2, 3, 3, 7, 3, 5, 5, 3, 5, 2, 3, 4, 3,...
## $ Bath
             <dbl> 4, 2, 3, 2, 3, 3, 2, 1, 2, 3, 5, 4, 4, 4, 3, 5, 2, 4, 3, 3,...
## $ AC
             <dbl> 1, 1, 1, 1, 1, 1, 1, 1, 1, 0, 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
## $ Garage <dbl> 2, 2, 2, 2, 2, 5, 2, 1, 2, 1, 2, 3, 3, 2, 2, 2, 2, 2, 2, 2, ...
## $ Pool
             <dbl> 0, 0, 0, 0, 0, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
             <dbl> 1972, 1976, 1980, 1963, 1968, 1972, 1972, 1955, 1975, 1918,...
## $ Year
```

```
## $ Quality <chr> "Home", "Home"
```

• Let's modify AC. We'll need backticks here since 1 and 0 are numerics.

```
estate %>%
     mutate(AC = recode(AC,
                                                           1 = "AC",
                                                           `O` = "No AC")) ->
     estate
glimpse(estate)
## Rows: 522
## Columns: 12
## $ Price
                                  <dbl> 360000, 340000, 250000, 205500, 275500, 248000, 229900, 150...
## $ Area
                                    <dbl> 3032, 2058, 1780, 1638, 2196, 1966, 2216, 1597, 1622, 1976,...
## $ Bed
                                    <dbl> 4, 4, 4, 4, 4, 4, 3, 2, 3, 3, 7, 3, 5, 5, 3, 5, 2, 3, 4, 3,...
## $ Bath
                                    <dbl> 4, 2, 3, 2, 3, 3, 2, 1, 2, 3, 5, 4, 4, 4, 3, 5, 2, 4, 3, 3,...
                                    <chr> "AC", "No A...
## $ AC
## $ Garage <dbl> 2, 2, 2, 2, 2, 5, 2, 1, 2, 1, 2, 3, 3, 2, 2, 2, 2, 2, 2, ...
## $ Pool
                                    <dbl> 0, 0, 0, 0, 0, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
## $ Year
                                    <dbl> 1972, 1976, 1980, 1963, 1968, 1972, 1972, 1955, 1975, 1918,...
## $ Quality <chr> "Home", "Ho
                                    <dbl> 1, 1, 1, 1, 7, 1, 7, 1, 1, 1, 7, 1, 7, 5, 1, 6, 1, 7, 7, 1,...
## $ Style
## $ Lot
                                    <dbl> 22221, 22912, 21345, 17342, 21786, 18902, 18639, 22112, 143...
```

• Exercise: Recode the Highway and Pool variables to have more informative values.

Recode with Logicals with if_else()

- Sometimes, it is easier to recode based on logical statements.
- For example, suppose we want to recode the "Bath" variable to have values 1, 2, 3, and >3. One way to do this would be:

```
## $ Bed
                                            <dbl> 4, 4, 4, 4, 4, 4, 3, 2, 3, 3, 7, 3, 5, 5, 3, 5, 2, 3, 4, 3,...
                                            <chr> ">3", "2", "3", "2", "3", "3", "2", "1", "2", "3", ">3", ">...
## $ Bath
                                            <chr> "AC", "No A...
## $ AC
                                           <dbl> 2, 2, 2, 2, 5, 2, 1, 2, 1, 2, 3, 3, 2, 2, 2, 2, 2, 2, 2, ...
## $ Garage
## $ Pool
                                            <dbl> 0, 0, 0, 0, 0, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
## $ Year
                                            <dbl> 1972, 1976, 1980, 1963, 1968, 1972, 1972, 1955, 1975, 1918,...
## $ Quality <chr> "Home", "Ho
                                             <dbl> 1, 1, 1, 1, 7, 1, 7, 1, 1, 1, 7, 1, 7, 5, 1, 6, 1, 7, 7, 1,...
## $ Style
## $ Lot
                                             <dbl> 22221, 22912, 21345, 17342, 21786, 18902, 18639, 22112, 143...
```

• But this is a lot of typing. But we know how to get obtain TRUE's and FALSE's based on whether a house has more than 3 bathrooms.

- if_else():
 - Takes a *logical* vector as its first argument.
 - It takes a vector that populates the TRUE values as its second argument.
 - It takes a vector that populates the FALSE values as its third argument.
 - The second and third arguments must be the same type (e.g. both logical, both numeric, both character, etc).
 - The second and third arguments must either be of length 1, or the same length as the logical vector.
 - It returns a vector with replaced values.

"2"

"3"

"4"

• Toy Example:

[1] "1"

```
x <- c(1, 2, 3, 4, 5, 6, 7, 8)
if_else(x > 4, 4, x)

## [1] 1 2 3 4 4 4 4 4

if_else(x > 4, x, 4)

## [1] 4 4 4 4 5 6 7 8

if_else(x > 4, "x > 4", as.character(x))
```

"x > 4" "x > 4" "x > 4" "x > 4"

```
if_else(x > 4, "x > 4", x) ## should error
```

Error: `false` must be a character vector, not a double vector.

- Exercise: Why did the last if_else() call error?
- Let's apply if_else() to the estate data frame. Recall: we need to use mutate() to modify a variable in a data frame.

```
estate %>%
        mutate(Bath = if else(Bath > 3,
                                                                                                               ">3",
                                                                                                               as.character(Bath))) ->
         estate_temp
glimpse(estate_temp)
## Rows: 522
## Columns: 12
## $ Price
                                                          <dbl> 360000, 340000, 250000, 205500, 275500, 248000, 229900, 150...
                                                            <dbl> 3032, 2058, 1780, 1638, 2196, 1966, 2216, 1597, 1622, 1976,...
## $ Area
                                                            <dbl> 4, 4, 4, 4, 4, 4, 3, 2, 3, 3, 7, 3, 5, 5, 3, 5, 2, 3, 4, 3,...
## $ Bed
                                                            <chr> ">3", "2", "3", "2", "3", "3", "2", "1", "2", "3", ">3", ">...
## $ Bath
## $ AC
                                                            <chr> "AC", 
## $ Garage <dbl> 2, 2, 2, 2, 5, 2, 1, 2, 1, 2, 3, 3, 2, 2, 2, 2, 2, 2, ...
                                                            <dbl> 0, 0, 0, 0, 0, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
## $ Pool
## $ Year
                                                            <dbl> 1972, 1976, 1980, 1963, 1968, 1972, 1972, 1955, 1975, 1918,...
## $ Quality <chr> "Home", "Ho
## $ Style
                                                            <dbl> 1, 1, 1, 1, 7, 1, 7, 1, 1, 1, 7, 1, 7, 5, 1, 6, 1, 7, 7, 1,...
## $ Lot
                                                            <dbl> 22221, 22912, 21345, 17342, 21786, 18902, 18639, 22112, 143...
```

• Exercise: Recode Price so that any price less than \$250,000 is just listed as "<250,000".

Dealing with NA's by replace_na()

\$ sex

• The starwars data frame from the dplyr package contains information on different characters from the Star Wars franchise:

<chr> "male", "none", "none", "male", "female", "male", "femal...

• The gender variable is missing for some individuals

```
starwars %>%
  filter(is.na(gender)) %>%
  select(name, gender)
## # A tibble: 4 x 2
##
                    gender
     name
##
     <chr>
                    <chr>
## 1 Ric Olié
                     <NA>
## 2 Quarsh Panaka <NA>
## 3 Sly Moore
                    <NA>
## 4 Captain Phasma <NA>
```

- But because programmers typically remove NA's, it might be reasonable to change this to something else like "other".
- replace_na()
 - Takes a vector as its first argument.
 - The second argument is the value with which to replace all NA's.
 - It returns a vector with the NA's replaced.
- Toy example:

```
x <- c("This", "is", "a", NA, NA, "vector")
replace_na(x, "foo")

## [1] "This" "is" "a" "foo" "foo" "vector"</pre>
```

• Let's replace the NA's in the gender variable in the starwars data frame. Recall: we need to use mutate() to modify a variable in a data frame.

• Exercise: In the starwars data frame, replace the NA's in hair_color with "bald".
