# Data Import

David Gerard 2019-02-14

### Learning Objectives

- Import data from CSV's,
- Working Directories
- Chapter 11 of RDS
- Data Import Cheat Sheet

### Working Directories

- The working directory is where R will look for and save things by default.
- When you specify to save a figure, save a file, or load some data, it will be with respect to the working directory.
- You can see where the current working directory is by getwd(), or by looking at the top of the console in RStudio.
- You can change the working directory by Session > Set Working Directory > Choose Directory. Or by CONTROL + SHIFT + H. Or you can use the setwd() command.
- A shortcut is to set the working directory to your source file location with Session > Set Working Directory > To Source File Location.
- When you read and write files/figures, you can then specify the path from the position of the working directory.
- Suppose we want to save the following figure:

```
suppressPackageStartupMessages(library(tidyverse))
data("mpg")
pl <- ggplot(mpg, aes(x = hwy, y = cty)) +
   geom_point()</pre>
```

• To save pl in the current folder, we would use:

```
ggsave(filename = "./my_saved_plot.pdf", plot = pl)
```

- The "." means "the current folder".
- $\bullet\,$  To save  ${\tt pl}$  in the folder one level up we would use:

```
ggsave(filename = "../my_saved_plot.pdf", plot = pl)
```

- The ".." means "go one level up".
- If we are in the analysis folder, and we want to save pl in the output folder, we would use:

```
ggsave(filename = "../output/my_saved_plot.pdf", plot = pl)
```

• If we have a subfolder called "fig" within out current folder. We could save pl in "fig" with

```
ggsave(filename = "./fig/my_saved_plot.pdf", plot = pl)
```

• NEVER USE ABSOLUTE PATHS. For example, you should never start the path from "C" if you use Windows. This makes your code non-transferable to other users.

#### readr

• A lot of datasets come in comma-separated or tab-separated formats. For example, These are the first few rows of hate\_crimes2.csv (available at https://dcgerard.github.io/stat\_412\_612/data.html):

```
state, median_house_inc, share_unemp_seas, share_pop_metro, share_pop_hs, share_non_citizen, share_white
Alabama, 42278, 0.06, 0.64, 0.821, 0.02, 0.12, 0.472, 0.35, 0.63, 0.125838926, 1.806410489
Alaska,67629,0.064,0.63,0.914,0.04,0.06,0.422,0.42,0.53,0.143740118,1.656700109
Arizona, 49254, 0.063, 0.9, 0.842, 0.1, 0.09, 0.455, 0.49, 0.5, 0.225319954, 3.413927994
Arkansas,44922,0.052,0.69,0.824,0.04,0.12,0.458,0.26,0.6,0.069060773,0.869208872
California,60487,0.059,0.97,0.806,0.13,0.09,0.471,0.61,0.33,0.255805361,2.397985899
Colorado,60940,0.04,0.8,0.893,0.06,0.07,0.457,0.31,0.44,0.390523301,2.804688765
Connecticut, 70161, 0.052, 0.94, 0.886, 0.06, 0.06, 0.486, 0.3, 0.41, 0.335392269, 3.772701469
Delaware, 57522, 0.049, 0.9, 0.874, 0.05, 0.08, 0.44, 0.37, 0.42, 0.322754169, 1.469979563
District of Columbia,68277,0.067,1,0.871,0.11,0.04,0.532,0.63,0.04,1.52230172,10.95347971
```

- In the file, each column is separated by a comma. Each row is separated by a new line.
- We will use the readr package to load these datasets into R.

share\_non\_citizen = col\_double(),

share\_non\_white = col\_double(),

share\_vote\_trump = col\_double(),

gini\_index = col\_double(),

share\_white\_poverty = col\_double(),

hate\_crimes\_per\_100k\_splc = col\_double(),

## ##

##

##

##

##

- The readr package is a part of the tidyverse, and so it is automatically loaded when you load the tidvverse.
- To read a CSV (comma-separated values) file into R, use the read\_csv() function from the readr package.

```
library(tidyverse)
hate_crimes <- read_csv(file = "../../data/hate_crimes1.csv")
## Parsed with column specification:
## cols(
##
                                                                                      share_non_citiz
     `state median house inc
                                share_unemp_seas
                                                     share_pop_metro share_pop_hs
## )
```

```
• If the CSV is online and you know the URL, you can use that URL for the file argument.
  library(tidyverse)
  hate_crimes <- read_csv(file = "https://dcgerard.github.io/stat_412_612/data/hate_crimes2.csv")
  ## Parsed with column specification:
  ## cols(
  ##
       state = col_character(),
  ##
       median_house_inc = col_double(),
  ##
       share_unemp_seas = col_double(),
  ##
       share_pop_metro = col_double(),
  ##
       share_pop_hs = col_double(),
```

```
## avg_hatecrimes_per_100k_fbi = col_double()
## )
```

- Use read\_tsv() if columns are separated by tabs. (if you use read\_lines() on a tsv, the tabs will show up as "\t").
- Use read\_csv2() if columns are separated by semicolons.
- Other file formats are listed in RDS.
- You want to import data directly from Excel? Don't.
  - First export the Excel spreadsheet as a CSV. Then read the CSV file into R.
- You are using colors to represent meaningful information in Excel? Don't.
  - Edit the data so that the information is encoded by a new variable.
- If you don't know the format ahead of time, use read\_lines() to print the first few lines.

```
read_lines(file = "../../data/hate_crimes2.csv", n_max = 10)
            [1] "state, median_house_inc, share_unemp_seas, share_pop_metro, share_pop_hs, share_non_citizen, share_non_
            [2] "Alabama,42278,0.06,0.64,0.821,0.02,0.12,0.472,0.35,0.63,0.125838926,1.806410489"
##
##
           [3] "Alaska,67629,0.064,0.63,0.914,0.04,0.06,0.422,0.42,0.53,0.143740118,1.656700109"
##
            [4] "Arizona, 49254, 0.063, 0.9, 0.842, 0.1, 0.09, 0.455, 0.49, 0.5, 0.225319954, 3.413927994"
            [5] "Arkansas,44922,0.052,0.69,0.824,0.04,0.12,0.458,0.26,0.6,0.069060773,0.869208872"
##
            [6] "California,60487,0.059,0.97,0.806,0.13,0.09,0.471,0.61,0.33,0.255805361,2.397985899"
            [7] "Colorado,60940,0.04,0.8,0.893,0.06,0.07,0.457,0.31,0.44,0.390523301,2.804688765"
            [8] "Connecticut,70161,0.052,0.94,0.886,0.06,0.06,0.486,0.3,0.41,0.335392269,3.772701469"
##
            [9] "Delaware,57522,0.049,0.9,0.874,0.05,0.08,0.44,0.37,0.42,0.322754169,1.469979563"
## [10] "District of Columbia,68277,0.067,1,0.871,0.11,0.04,0.532,0.63,0.04,1.52230172,10.95347971
```

### **Special Considerations**

- Always check your data immediately after importing it.
  - Check that the types are correct for each of the variables.
  - Check that the missing data were coded correctly.
  - Later on, when you notice something weird, consider that this might have resulted because of a problem during data import.

```
hate_crimes %>%
  summarize all(class)
## # A tibble: 1 x 12
##
     state median_house_inc share_unemp_seas share_pop_metro share_pop_hs
##
     <chr> <chr>
                            <chr>
                                              <chr>
                                                              <chr>
## 1 char~ numeric
                            numeric
                                              numeric
                                                              numeric

- Sometimes the files code missing data other than NA. For example, it's common to use periods ., or in some genomic settings they use -9 as missing.
- R won't know how to handle this without you telling it, so you'll have to know what the missing data encoding is and specify it with the na argument in read\_csv().
- readr will try to guess the type for each column (double, integer, character, logic, etc). Sometimes it guesses wrong. If it seems to be guessing wrong, use the col\_types to explicitly specify the column types.
- Sometimes there are comments at the start of a data file. You can skip the first few lines before starting to read data with the skip argument.
- If the comments begin with a special character, you can use the comment argument.
- Exercise: Successfully load all of the hate\_crimes CSV files at https://dcgerard.github.io/stat\_412\_612/data.html.

## Data Export

##

## 1

<int>

<int>

0

- You can write comma-separated and tab-separated files using write\_csv(), write\_csv2(), and write\_tsv().
- The defaults are usually fine.

## Reading/Writing R Objects

• You can save and reload arbitrary R objects (data frames, matrices, lists, vectors) using readRDS() and saveRDS().
